

organic spectroscopy principles and pdf

Infrared spectroscopy (IR spectroscopy or vibrational spectroscopy) involves the interaction of infrared radiation with matter. It covers a range of techniques, mostly based on absorption spectroscopy. As with all spectroscopic techniques, it can be used to identify and study chemicals. Samples may be solid, liquid, or gas.

Circular dichroism (CD) is dichroism involving circularly polarized light, i.e., the differential absorption of left- and right-handed light. Left-hand circular (LHC) and right-hand circular (RHC) polarized light represent two possible spin angular momentum states for a photon, and so circular dichroism is also referred to as dichroism for spin angular momentum.

The conceptual approach by which a metal-organic framework is designed and assembled is termed reticular synthesis and is based upon identification of how building blocks come together to form a net, or reticulate.

Metal-organic frameworks: a new class of porous materials

1. Introduction. Spectroscopy is the study of interaction of electromagnetic radiation with matter.

Spectroscopic methods can be based on phenomena of emission, absorption, fluorescence or scattering.^{1, 3} Different spectroscopic methods are frequently used for the characterization of a wide range of samples of forensic interest. These methods are used for qualitative and quantitative analysis ...
