oxidation and reduction without pdf

The oxidation state, sometimes referred to as oxidation number, describes the degree of oxidation (loss of electrons) of an atom in a chemical compound. Conceptually, the oxidation state, which may be positive, negative or zero, is the hypothetical charge that an atom would have if all bonds to atoms of different elements were 100% ionic, with no covalent component.

Reduction potential (also known as redox potential, oxidation / reduction potential, ORP, pE, $\hat{\mu}$, or) is a measure of the tendency of a chemical species to acquire electrons and thereby be reduced. Reduction potential is measured in volts (V), or millivolts (mV). Each species has its own intrinsic reduction potential; the more positive the potential, the greater the species' affinity for ...

Elements with multiple redox states efficiently decompose H₂O₂ at neutral pH.. Activation of H₂O₂ is entirely governed by solution pH and catalyst composition.. Metal leaching and toxicity is an important factor for practical applications.
