Our lab uses functional genomic approaches to dissect complex traits in maize, cassava, and grapes. We exploit the natural diversity of these plant genomes to identify the individual nucleotides responsible for complex (quantitative) variation and then apply it to US and global breeding.

Genetics is a branch of biology concerned with the study of genes, genetic variation, and heredity in organisms.. Gregor Mendel, a scientist and Augustinian friar, discovered genetics in the late 19th-century. Mendel studied "trait inheritance", patterns in the way traits are handed down from parents to offspring. He observed that organisms (pea plants) inherit traits by way of discrete "units ...

Selective breeding was established as a scientific practice by Robert Bakewell during the British Agricultural Revolution in the 18th century. Arguably, his most important breeding program was with sheep. Using native stock, he was able to quickly select for large, yet fine-boned sheep, with long, lustrous wool.

1. Introduction. Classical breeding of wheat (*Triticum aestivum* L. and *T. durum* Desf.) has evolved dramatically in the last century. This has been the combined result of implementation of accurate experimental field designs, statistical methods, the development of doubled haploids (DH), the application of the concepts of quantitative and population genetics, and the integration of various plant ...
